

Research Portal — Therapist Guide

How to use the AI Support Agent admin portal as a **therapist**: the clinical-oversight role. You hold the full clinical data tier — session transcripts (redacted), AI clinical summaries, screener trajectories, and signed notes. Screenshots come from a practice sandbox with entirely synthetic clients; your own account starts in exactly such a sandbox (the amber banner) until you're assigned real participants.

1. Your caseload

Welcome to your sandbox

A synthetic caseload has been assembled for you: browse the triage roster, work the queue, review notes and escalations, and try messaging. Everything here is fake data — nothing you do reaches real participants or the on-call pager.

My Caseload

8 assigned clients

Client Invites

Create a one-time link a new client can use to register. They are assigned to you automatically.

Your landing page: every client assigned to you, plus **Client Invites** — one-time links that register a new client directly onto your caseload. Everything else in the portal is scoped to these people; you never see clients who aren't yours.

2. Triage — who needs you today

Risk

☐ No active flags

Risk sharing off

The participant has completed four sessions and is showing signs of improvement, particularly in mood, which has recently increased from a 3 to a 6. They successfully navigated a challenging anniversary week with the support of their sister, and their dark thoughts have quieted during this time. Recent discussions have focused on grief, sleep, and feelings of guilt, and it will be important to follow up on their use of the safety plan in the next session. Overall, the participant's mood trajectory appears to be positive, but continued support and monitoring will be essential.

AI-generated summary — verify against the record.

sleep anniversary reaction grief

Mood: Improving

The clinical heart of the portal. Top strip: PHQ-2/GAD-2 and mood with trend arrows, session count, and risk state. Below: an AI-generated summary (always verify against the record — it says so on the tin), then the session timeline with crisis tags, safety-plan events, per-session topics, moods, and follow-ups. Deeper in the profile: the prep brief ("since you last looked..."), risk timeline chart, session insights, and the notes panel. This is also where you start a progress note from the AI's SOAP draft.

4. Work Queue — ack and resolve

Everything that needs a human lands here: crisis flags, inbound escalations, worsening screeners, stale unread messages, inactivity. **Ack** claims an item; **Resolve** closes it with a short note that becomes part of the audit trail. Below the queue, set your notification preferences — daily digest timing and whether urgent safety items email you immediately (they should).

5. Escalations — hand-offs from caseworkers

Caseworkers raise structured escalations to you ("client disclosed passive ideation during a check-in; requesting a clinical follow-up call"). Acknowledge, work it, and resolve with a disposition — the red nav

badge counts what's still open. This is the clinical backstop path the study protocol depends on, so open escalations are your first priority after crisis flags.

6. Messages

Secure asynchronous messaging with clients on your caseload, started from a client's profile. Participants are told replies take 1-2 business days, and every participant message is automatically safety-scanned — anything alarming also lands in Crisis Management and your work queue, so the inbox is never the only net.

7. Also in your nav

- **Live Monitoring / Sessions / Analytics** — watch active sessions in real time (with sideband controls to inject a message or end a session), browse full session history, and see usage analytics.
- **Crisis Management** — all crisis events and interventions for your clients; you can clear flags and record wind-downs.
- **Adverse Events** — review and sign off IRB adverse-event reports involving your clients.
- **Clinical notes** — SOAP-structured, autosaving drafts; **signing makes a note immutable** (amend-only afterward). Sign only what you've verified.
- **Export / Rate Limits** — session data export and rate-limited user list.

Sandbox first: practice every workflow above on your synthetic caseload — nothing there reaches real participants, pagers, or email. Version 2026-09-04.
